

iRise Connect for IBM Rational Requirements Composer

Bring the power of high-fidelity visualization together with IBM

Visualization from iRise is now the de facto standard for how smart organizations define business software. Visualizations give business people a better way to communicate their needs to technology teams. Now all stakeholders can interact with and fully experience applications before they are built. By enabling global organizations to “test drive” critical business systems early in the process, iRise is an essential part of their strategy to modernize, consolidate applications, accelerate project delivery and leverage global sourcing partnerships without the usual confusion and risk.

iRise Connect for IBM® Rational Requirements Composer™ makes high-fidelity iRise visualizations instantly accessible from within IBM Rational Requirements Composer. With iRise Connect, Requirements Composer truly becomes a single collaborative environment where software delivery teams can aggregate textual and visual business artifacts such as storyboards, scenarios, flow diagrams and iRise visualizations. As a result, IBM and iRise provide a complete requirements definition solution that ensures that the right application requirements are being captured, defined, collaborated on and managed through the product life cycle.

Benefits:

- Speed consensus and ensure solutions meet the needs of business
- Accelerate time to market
- Cut project cost by eliminating rework
- Dramatically improve customer experience and adoption
- Ensure success of global sourcing strategies

“Interactive, immersive software visualization is an important component to solving the endemic problem with requirements on software projects. iRise is the market leader with this capability, having proven the benefits of visualization across a broad set of industries and application types.” - Michael Loria, Vice President of Business Development, IBM Rational Software.
